

# The Agent Loop

The Engine Behind Everything We Build

Made with GAMMA

# What's the Difference?

One input. One output.

Keeps going until  
the job is done.

## One-shot vs. persistent

A vending machine gives you exactly what you asked for — nothing more, nothing less. An employee keeps working until the job is truly done.

# The Chatbot Model

| One message in | One reply out |
|----------------|---------------|
| Done           |               |

ChatGPT, Claude — they respond once and stop. No follow-through. No persistence.

# The Agent Model

Keeps thinking, checking, and acting — **until the job is done.**

# The Core Loop

## Think → Act → Check → Repeat

The agent decides if it has enough information. If not, it uses a tool, gets a result, and thinks again. Once satisfied — it delivers the **Final Answer**.

- ❏ The loop exits only when the agent has enough information to answer.

# The Agent Loop.

Every agent you build in this course — the support agent, the manager agent, the risk agent — runs on this exact loop.

**Support Agent**

**Manager Agent**

**Risk Agent**
