

From One Agent to Many

What is Agentic AI?

Understanding multi-agent collaboration — and why it changes how you build.

RECAP

One Agent. One Job.

Thinks

Perceives context, reasons about goals

Acts

Calls tools, makes decisions autonomously

Owns

A single, well-defined responsibility

The Hospital Model

Each doctor has their own expertise

Each makes their own decisions. They collaborate — but never hand off control blindly.

i This is the pattern behind multi-agent systems.

SAME PATTERN, DIFFERENT DOMAIN

Hospital → Our Project

Hospital Roles

- General Physician → Specialist
- Second Opinion

Our Agents

- Support Agent → Manager Agent
- Risk Agent

Meet the Agents

Support Agent

Talks to the customer, gathers context, decides what happens next.

Manager Agent

Reviews complex cases, applies policy, makes high-stakes decisions.

Risk Agent

Analyzes fraud patterns, evaluates signals, delivers a verdict.

KEY INSIGHT

You are designing an organisation.

You decide the agents

You write their job descriptions

You define their tools

Your Django models, ORM queries, and views **become** the tools these agents use.

You decide when they escalate

Made with GAMMA

UP NEXT

The Agent Loop

The code pattern that powers everything we just discussed.

1

Observe

2

Reason

3

Act

4

Loop
